

GRANITE

FAQ'S

1. Is granite highly durable?

Granite is known for its exceptional durability, and the stone is hard enough to resist moderate scratches or chips even if installed in high-use areas.

2. Are granite surfaces stain-resistant?

No, stains will appear on granite surfaces if not cleaned promptly. Granite is a porous stone, which means it absorbs liquids and potentially develops stains.

3. Can granite countertops stand up to heat and scratches?

Your granite countertops can withstand constant heat exposure. Also, cutting vegetables directly on a granite countertop might not scratch the surface, which is why the material is suitable for use in kitchen areas.

4. Is sealing necessary for my granite countertop?

Yes. Sealing granite surfaces might be necessary to maintain their look and longevity. Consider re-sealing the surface at regular intervals.

5. How often should my granite countertops be resealed?

Consider re-sealing your granite countertops every six months to prevent stains and scratches from daily use. Apply high-quality sealants for best results.

6. Does granite come in different surface finishes?

Yes, two popular shades are honed and polished granite. Honed granites come in a matte finish, while polished stones appear more glossy.

7. Can minor scratches on granite surfaces be repaired?

Chips or cracks on granite surfaces can be fixed using a color-matching epoxy or resin. Use quality products for best results.
